

Introducing FogLAMP

The Open Source Platform for the Internet of Things

Ivan Zoratti - Chief Product Officer - Dianomic Systems
Mark Riddoch - Chief Architect - Dianomic Systems

Who Are We?

We are Dianomic Systems - *Our mission: Simplify IoT Data*

Dianomí greek = Distribution english

The distribution of IoT data networking, processing, security and storage makes managing it complicated. Simplifying IoT application and system development with an ubiquitous open source platform, standards and community is Dianomic's mission.

Conference Theme & Keywords

The word cloud is centered around the theme of **Digital Transformation**. Other prominent terms include **Operational Intelligence**, **Infrastructure**, **Community**, **Analytics**, **Real-time**, **Event Frames**, **Integrators**, **Partner**, **Ecosystem**, **Asset Framework**, and **Big Data**. The words are colored in shades of blue, orange, and yellow, with some smaller terms like **Energy Management**, **Time Series**, **Asset Health**, **Quality**, **Reliability**, **Business Impact**, **Enterprise**, **PI System**, **Visualization**, **Streaming Data**, **CBM**, **Safety**, **Scalability**, **Connectivity**, **Enterprise Agreement**, **Operational Efficiency**, and **Future Data** appearing in smaller sizes.

Conference Theme & Keywords

Welcome! (and Agenda)

- IoT, IIoT and Fog Computing
- What Is FogLAMP?
- Use Cases
- FogLAMP Architecture
- Demo
- Next Steps
(FogLAMP Roadmap)

Industrial IoT Challenges

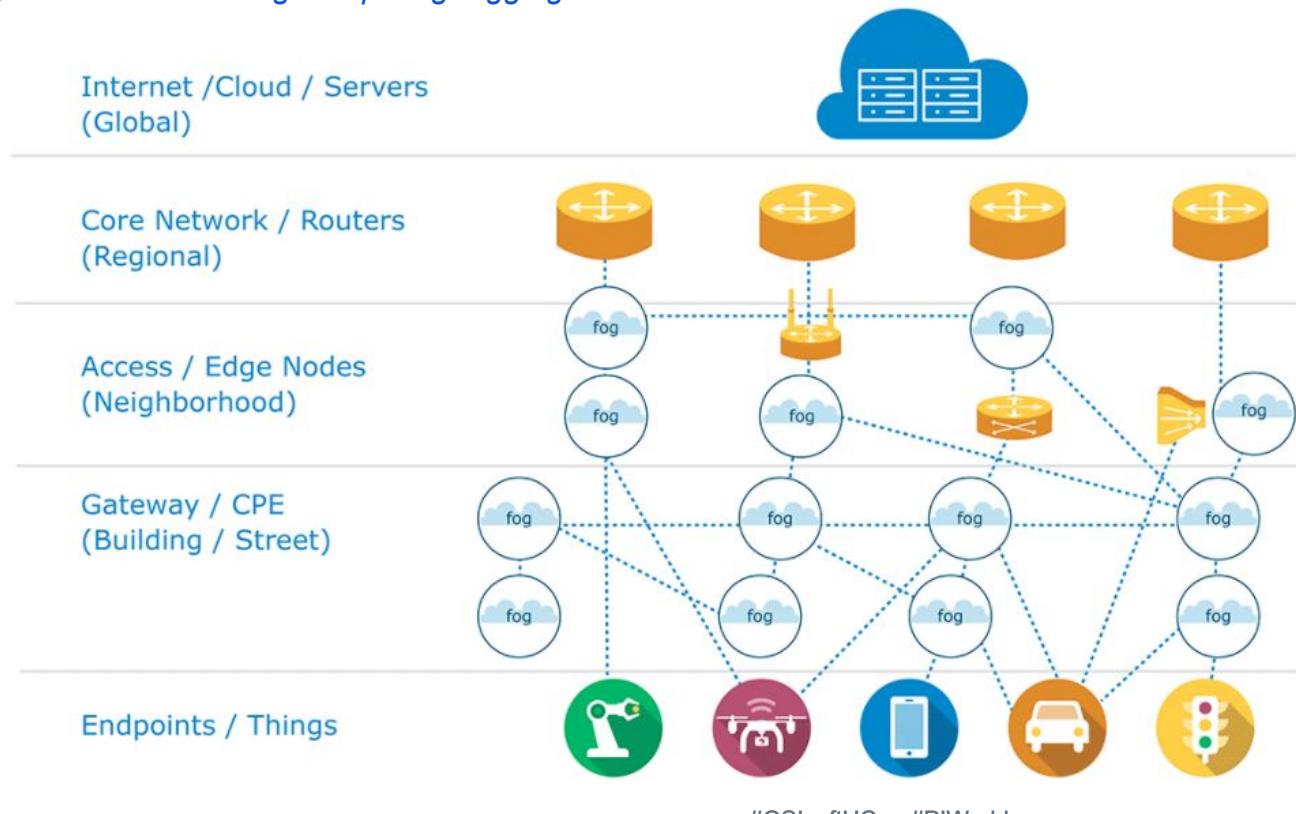

Combined Surveys:
• Morgan Stanley
• HP
• Gartner

- Security concerns
- Lack of standardization
- Lack of skills
- Upfront investments
- Legacy-installed base
- Data integrity
- Internal system barriers
- Liability of current technologies
- Social/political concerns
- Lack of solutions/technologies

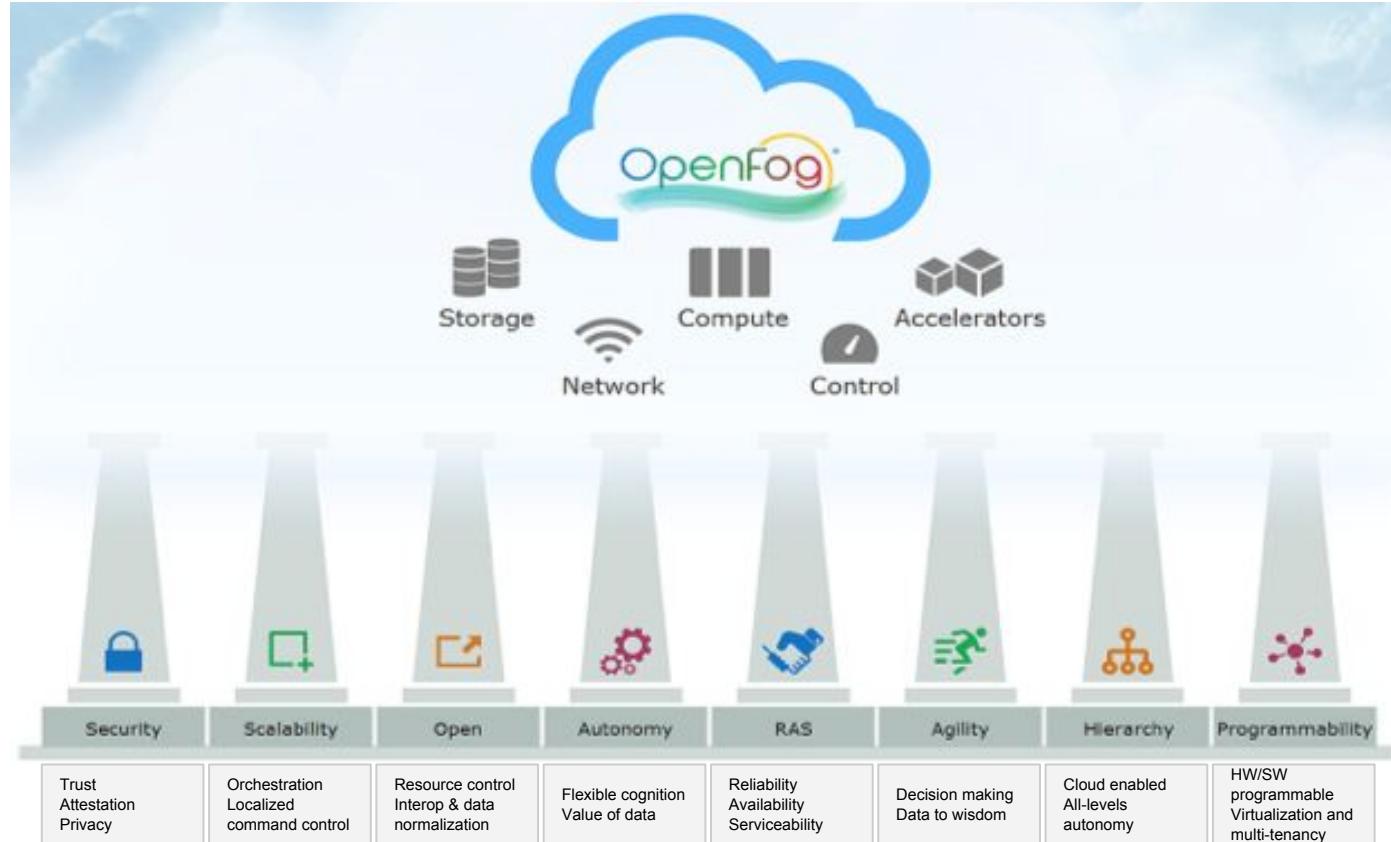

Introducing Fog Computing

<http://internetofthingsagenda.techtarget.com/definition/fog-computing-fogging>

"A decentralized computing infrastructure in which data, compute, storage and applications are distributed in the most logical, efficient place between the data source and the cloud."

Eight Pillars of an OpenFog Reference Architecture

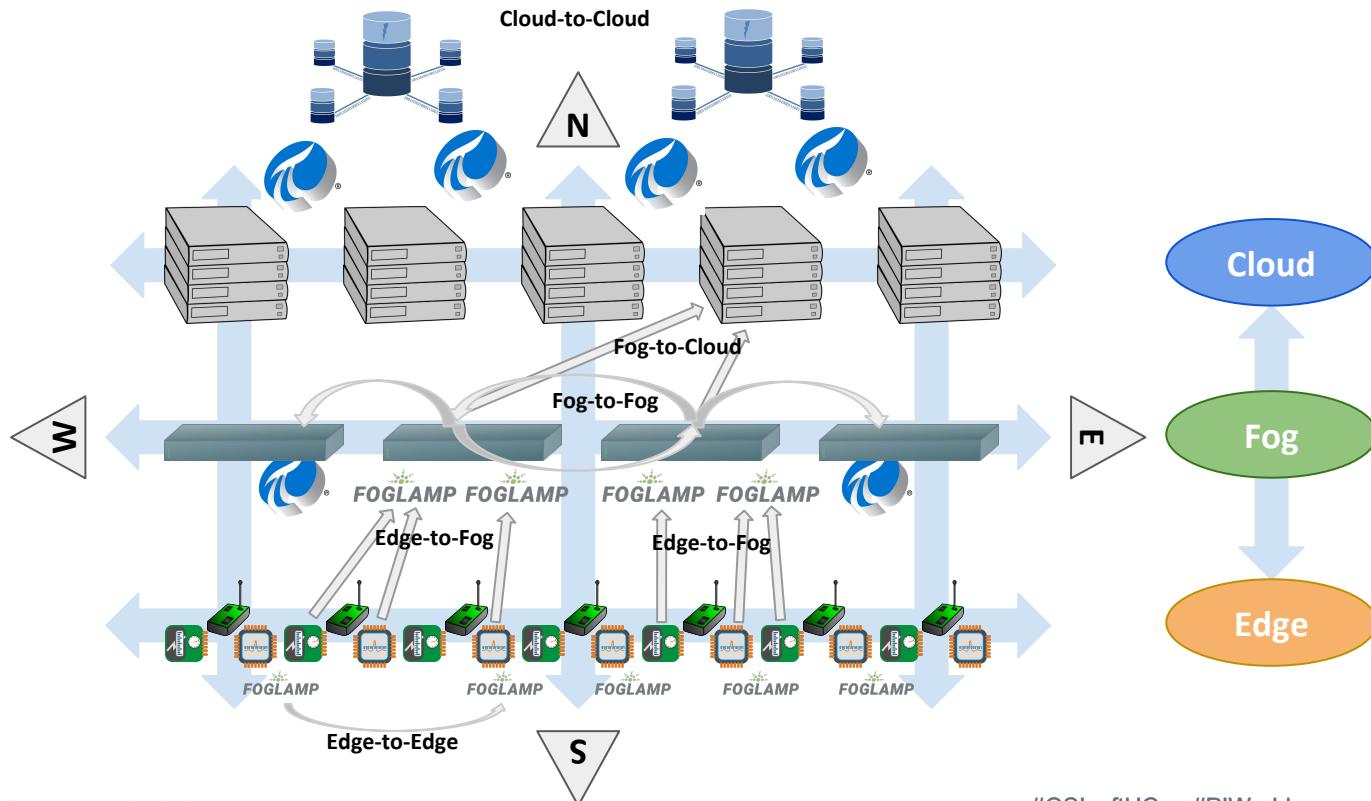

Introducing FogLAMP

*FogLAMP is a platform for the **Internet of Things** and an essential component in **Fog Computing**.*

*It uses a modular **microservices architecture** including sensor data collection, storage, processing and forwarding to historians, Enterprise systems and Cloud-based services.*

FogLAMP can run in highly available, standalone, unattended environments that assume unreliable network connectivity.

Introducing FogLAMP

FogLAMP is...

- Open Source
- Written in C/C++ and Python
- Available on a large number of platforms and environments
- Available on GitHub and in our apt repository

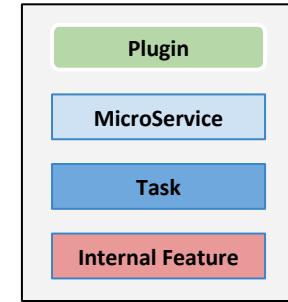

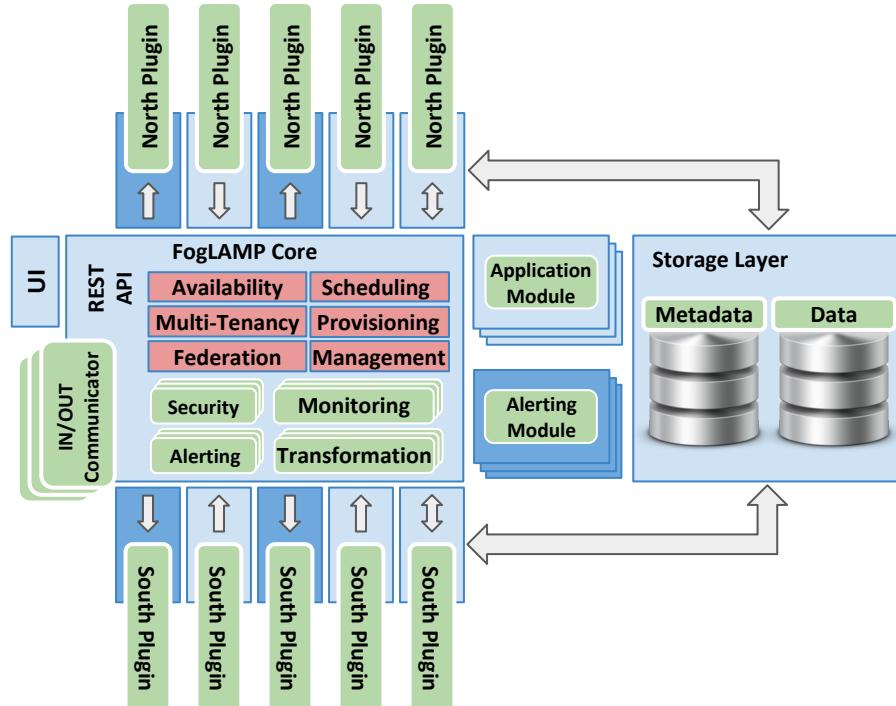

Available under a permissive Apache 2.0 license

Applications and Microservices plugins can be written in any language

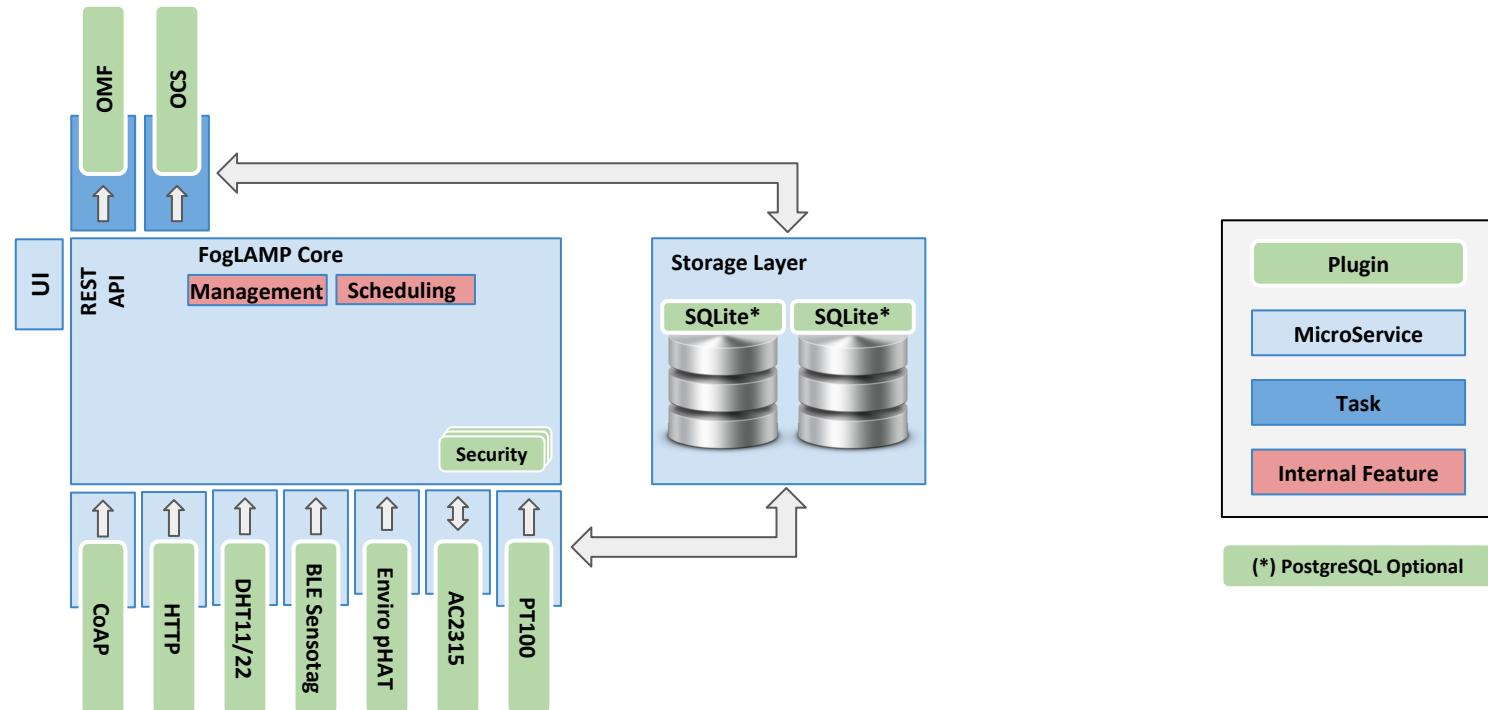

We develop in Ubuntu/Debian platforms on Intel and we deploy on Intel, Cortex-A, but also Cortex-M or even on 32-bit microcontrollers as little as 80KB of RAM.

<https://github.com/foglamp/FogLAMP>

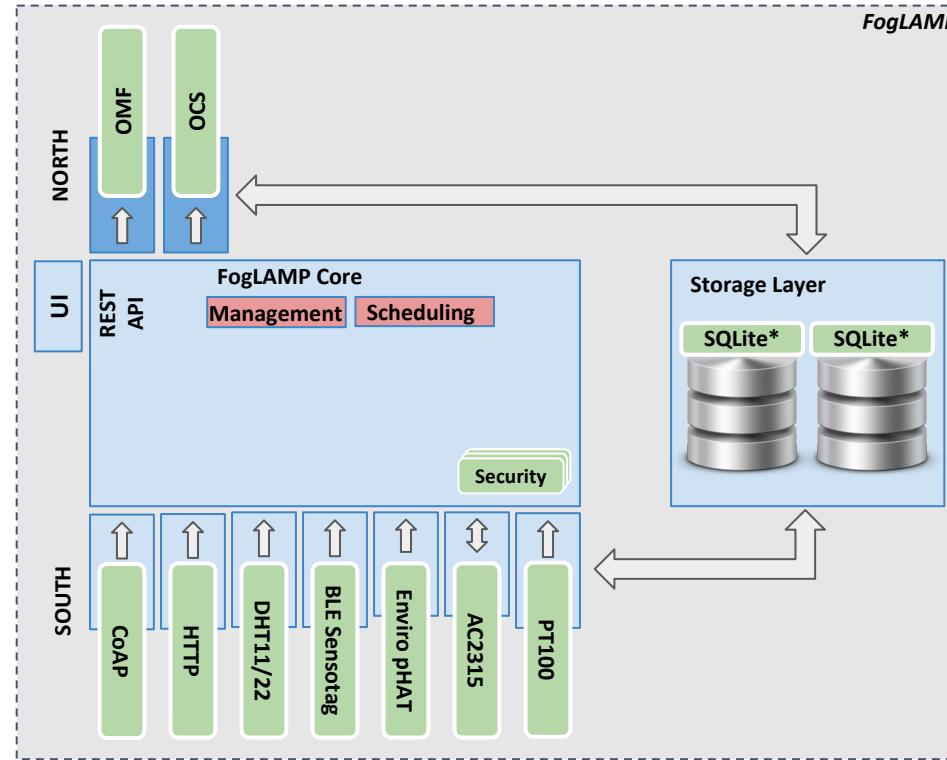

FogLAMP Architecture

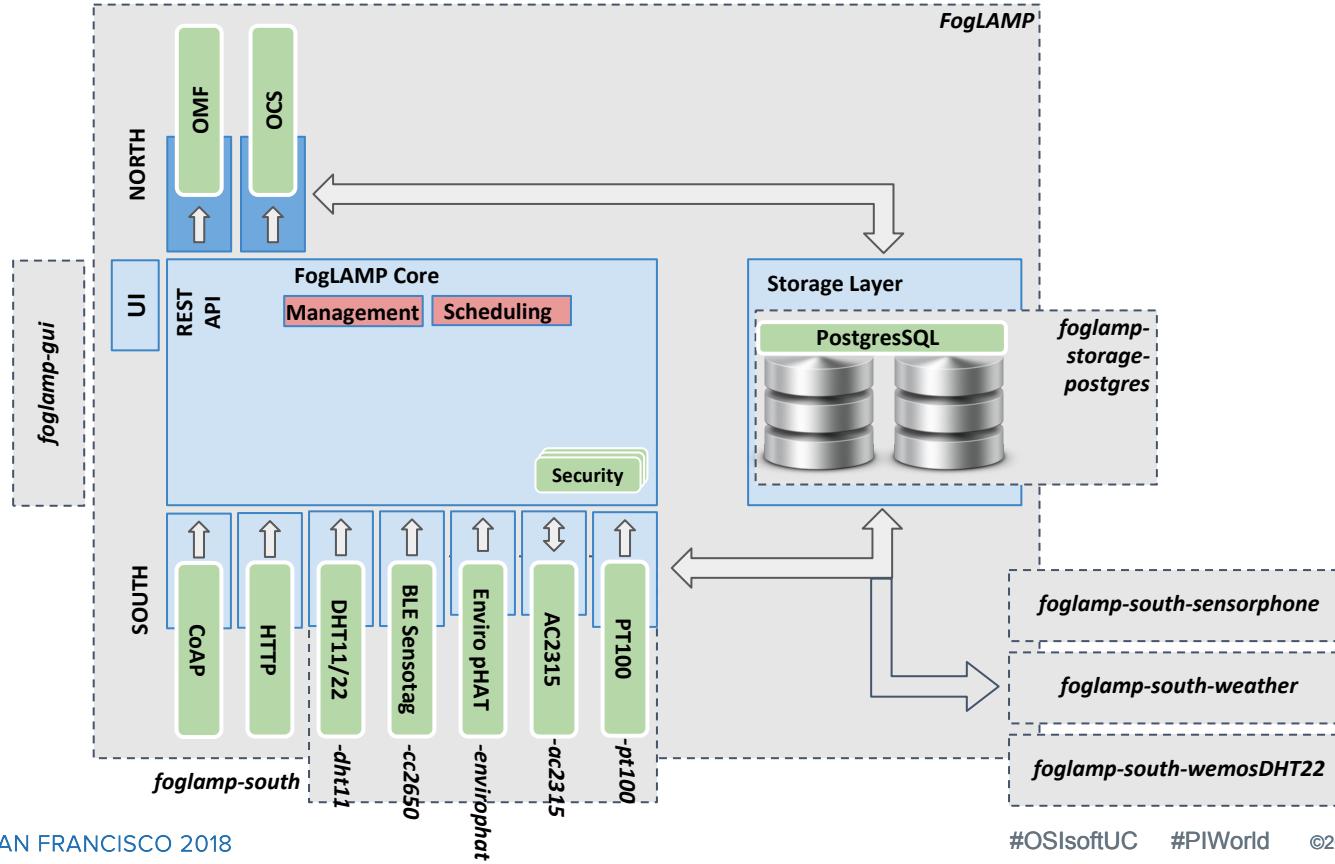

FogLAMP 1.2 - Implementation

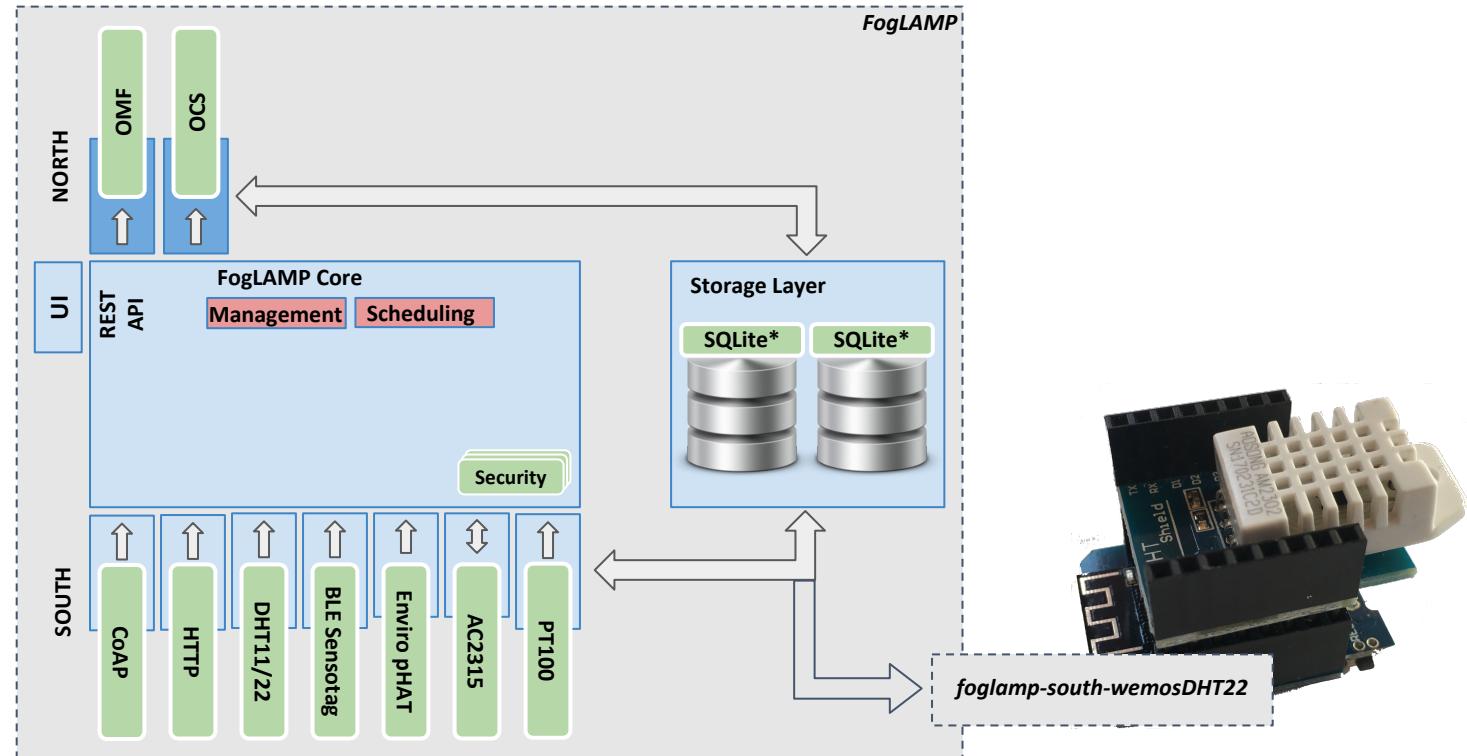

FogLAMP 1.2 - Implementation

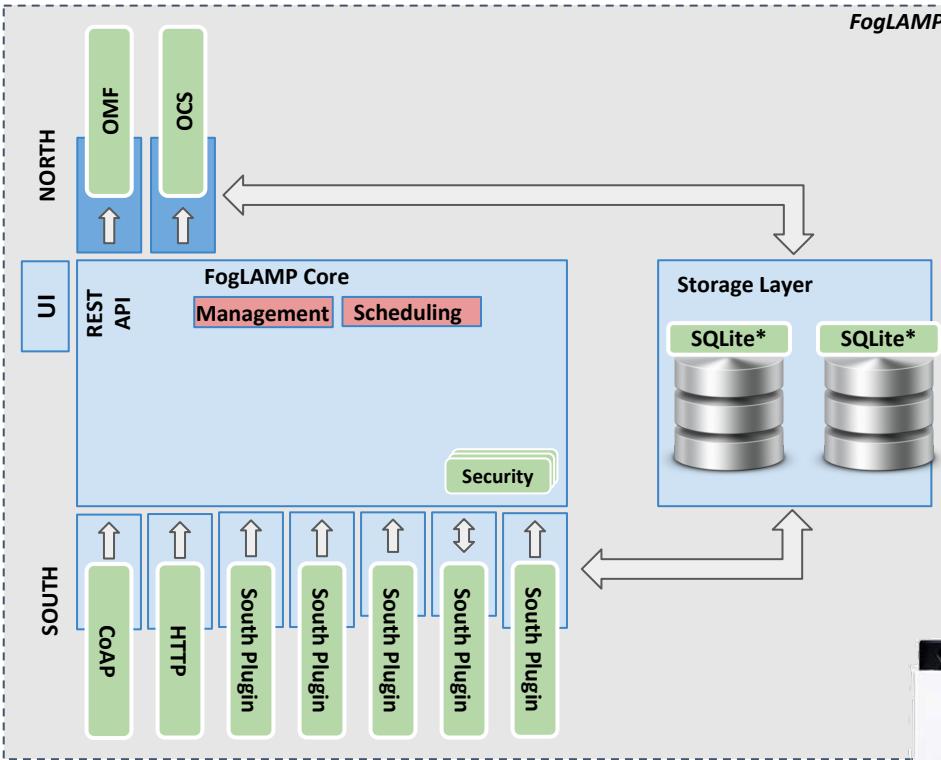

FogLAMP 1.2 - Implementation

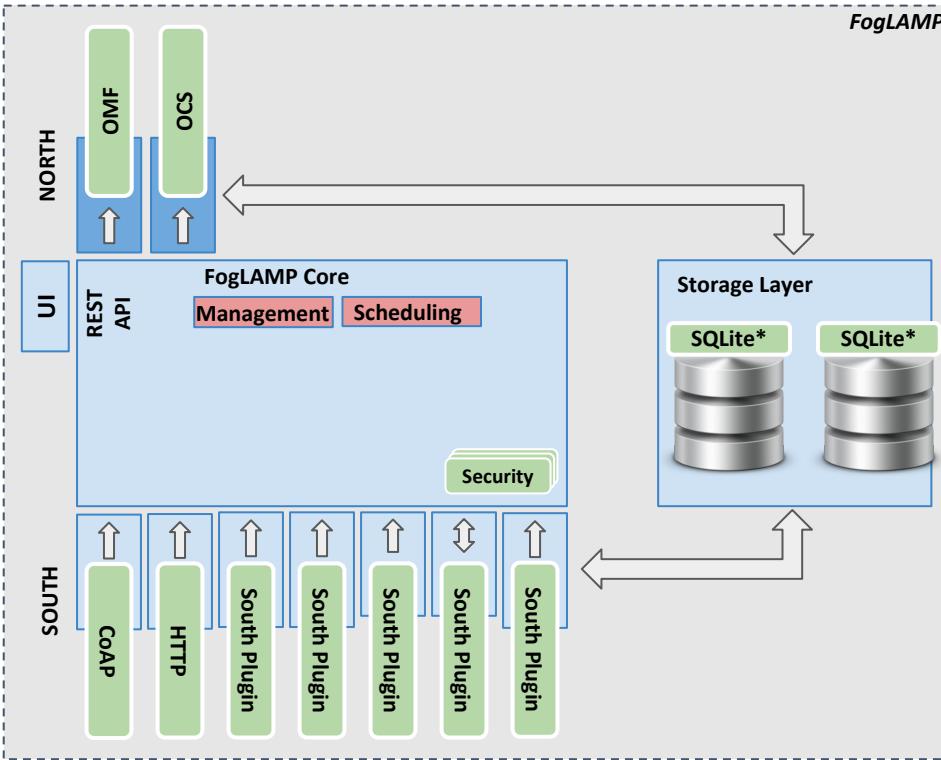

FogLAMP 1.2 - Implementation

FogLAMP 1.2 - Implementation

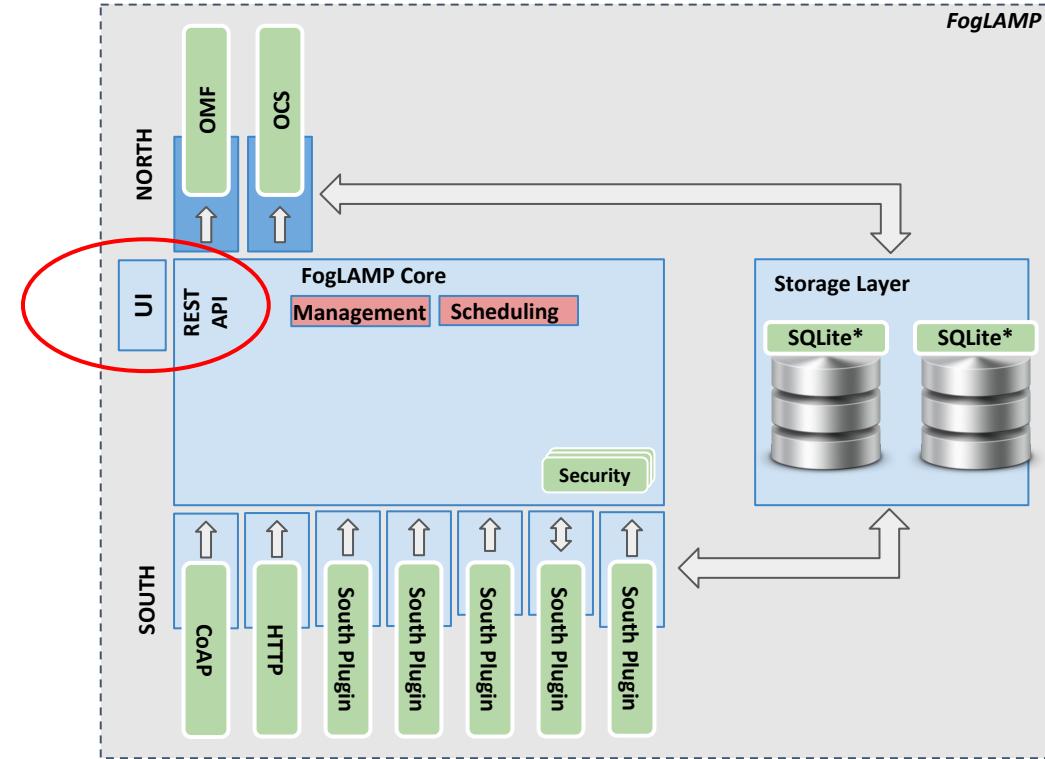

FogLAMP 1.2 - Implementation

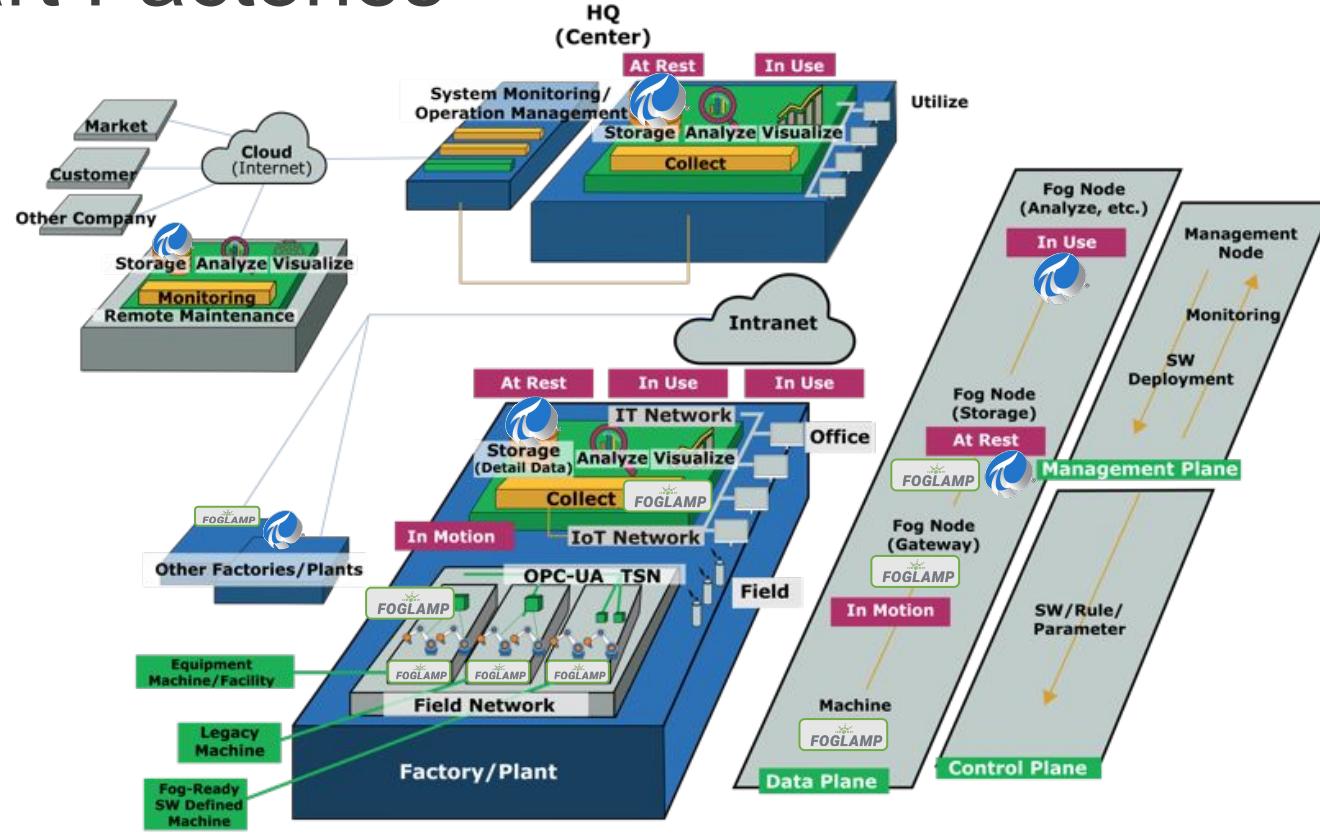

- On *Debian*
 - Ubuntu, Ubuntu Core, Raspbian, OpenWrt
- *Red Hat*
 - CentOS
- We are working on:
 - Yocto
 - mbed OS

FogLAMP 1.2 - The REST API

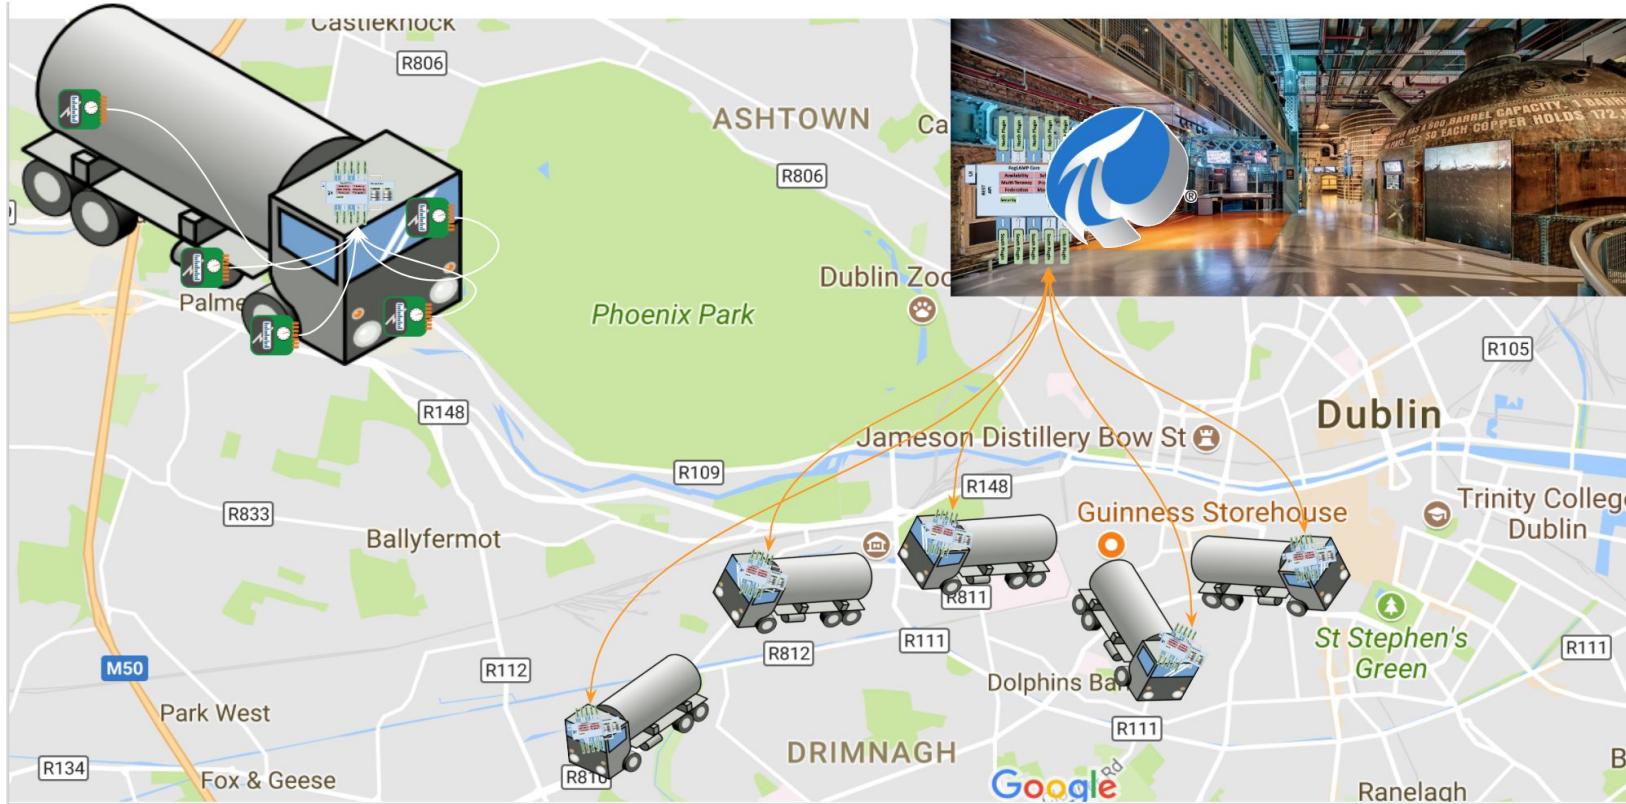

- Essential interface used to:
 - Manage and administer FogLAMP, FogLAMP microservices, plugins, users etc.
 - Provide a realtime status of the sensors and devices connected to FogLAMP
 - Send/manage the configuration of sensors and devices
- Available via HTTP/HTTPS

Smart Factories

Smart Fleets

Mining Plants

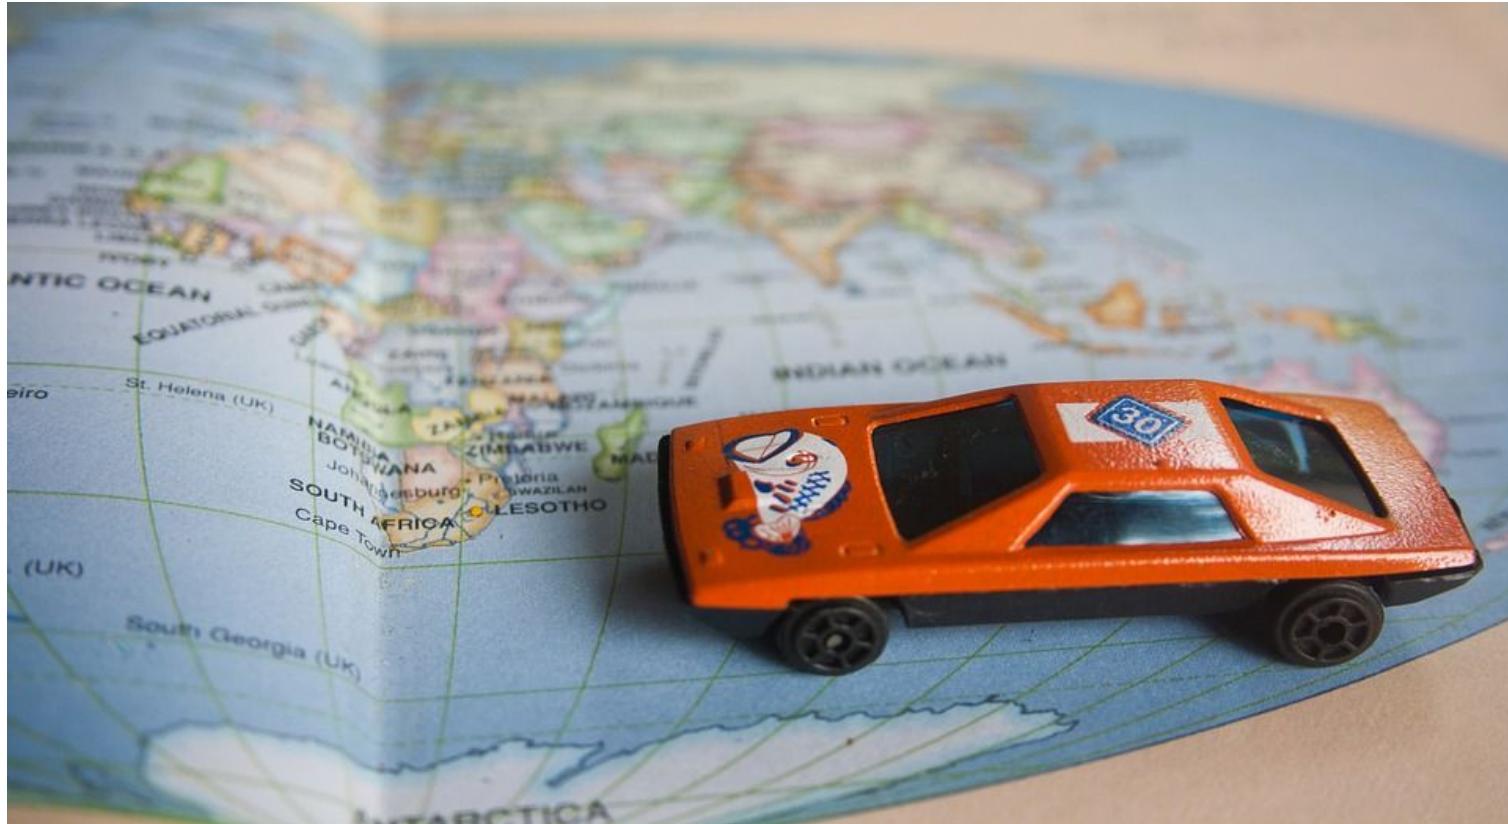

Smart Roads

Roadmap and Next Steps

Reducing Storage and Memory Footprint

- Moving Python-based microservices to C/C++
 - Developers can still create their plugins in Python or other languages, if they wish
 - Initial memory footprint will be about 1/3 of the current footprint
- Removing 3/4 of the current dependencies by moving plugins out of the main repository / package
 - This will massively reduce the storage footprint
 - The repositories will be more “clean”, i.e. easier to use/study/improve
 - Dependencies will be clear and they will be the starting point for a marketplace

Service Distribution and Port

- Implementing a real, Fog-based distributed architecture
 - We will implement *South* microservices on small devices, leaving *Core*, *Storage* and *North* microservices in FogLAMP instances used as “concentrators”
 - FogLAMP relays: in large environments (i.e. thousands of smart sensors and devices) small FogLAMP instances transfer data to larger FogLAMP instances and to PI Server(s)
- Completing the port of FogLAMP on other environments
 - Support for the Yocto project
 - Full support to OpenWrt
 - FogLAMP in mbed OS (as a whole or by micro/nano service)

Plugins

- Accepting plugin contributions or implementing them on request
 - There are thousands of libraries/devices/drivers. We hope developers will contribute and provide plugins to increase the offer

Management

- Fully functional interface
 - Now that we have the REST API, we need:
 - A command-Line interface to orchestrate installation and management
 - A control GUI to manage a large number of FogLAMP instances
- Enhance FogLAMP security at all layers and components
 - We have security plugins that can be used to work with North/South services and devices, East/West users and applications
- FogLAMP Control Center
 - Used to deploy, configure and control FogLAMP and the smart sensors and devices accessible via microservices and plugins
